Tutorial #4 – Oct 19

You can simply write out your answers here on the page. I have also provided a file named tutorial4_start.html which contains a <script> element where you can run your JavaScript if you so wish.

Exercise 1

Use the `prompt()` function to ask the user for a number. If the user's entry is not a number, display an error message using `alert()`.

Exercise 2

Use the `prompt()` function to ask the user for a grade (a number between 0 and 100). Display the letter grade (A >=85, B >= 70, C >=60, D >= 50, otherwise F) using `alert()`.

Exercise 3

Modify the previous exercise to also ask the user for a name (that is, use prompt twice). Then use string concatenation to display both the user name and the grade in the alert.

Exercise 4

Use the `prompt()` function twice. First to ask the user for a string of characters, and second to ask the user for a search string. Use the `includes()` function of the string to check if the search string appears in the first string. Display an alert that indicates whether the string appears or not. In your alert message, be sure to include both strings.

Exercise 5

Use the `prompt()` function to ask the user for a string of characters. Count the number of vowels in that string. To do this, use `length` property (in the loop) and the `substring` function (to extract a character from a string of vowel) and the `includes` function (to check for a vowel character in the search string) within a loop. Display the count of the number of vowels.

Exercise 6

Create an array of names containing at least four elements. Use a classic for loop to output these names to the console.

Exercise 7

Create an array of numbers containing at least four elements. Use a for…of loop to sum these numbers and display the sum to the console.

Exercise 8

Use the same array of numbers, use a loop to programmatically determine the largest number in the array (use an if statement within the loop) and then display that number to the console.

Exercise 9

Use prompt to ask the user for a name. Add it to the array of names in Exercise 6 using push. Output the array to verify it works.
