

# Tutorial #2 – CSS Selectors – Sept 28

Each of the following tutorial exercises contain a problem that you need to solve. This will require editing the starting file so that you can test them in a browser. Each of the exercises refer to a numbered class corresponding to the exercise (e.g., .ex01 for exercise 1) , so you will mainly be able to use a simple class selector, though some of them will also additional selectors or descendent selectors as well. Do not use flex or grid.

### 3612 Tutorial 3: CSS Practice

Eleven small exercises for core CSS: color, type, borders, spacing, shadows, backgrounds, hover states, and lists. No positioning, floats, flexbox, or grid — just the fundamentals.

The test markup for these exercises is contained within the <section> elements with class="demo". You will also see a <div> element with class="ex01/ex02/etc". You will modify these ex## classes.

#### 01 Typography

Change the typography styles for the provided paragraph for this exercise: font-family to “Times New Roman, serif”, font-size to 1.5em, and font-weight to bold

But, if constructing the future and settling everything for all times are not our affair, it is all the more clear what we have to accomplish at present: I am referring to ruthless criticism of all that exists, ruthless both in the sense of not being afraid of the results it arrives at and in the sense of being just as little afraid of conflict with the powers that be.

#### 02 Pseudo-Selectors

For the provided link, change the link color.

[Sample link](#)

1. Change the typography styles for the provided paragraph for this exercise: font-family to “Times New Roman, serif”, font-size to 14px, and font-weight to bold.
2. For the provided link, change the link color.
3. Change the provided div so that the background color is #cdd3dd and the text color is 102 red, 51 green, 153 blue.
4. Add borders for the provided div: 1px wide, solid, and with a color of lightslategray. Round its corner using border-radius. Add padding of 10px.
5. The three images in the provided div are on the same line since images are inline elements. Use the display property so that these images are on separate lines.
6. The three span elements in the provided div are right next to one another. Use the display property and margin properties so that there is space between the divs.
7. For the provided p, add a soft drop shadow with box-shadow. Its syntax is x-offset y-offset blur-radius color, e.g. 0 4px 12px rgba(0,0,0,0.2). Also add some padding.
8. For the provided button, change the background color, the font size and color, the height, and add rounded corners. Use the :hover pseudo selector to change the font color and the cursor property to pointer when the mouse hovers over the button.
9. For the provided unordered list, remove the default bullets (use list-style-type) and indentation. Add some margin space between the elements.
10. For the provided unordered list, turn it into a horizontal navigation bar: that is, all the items on one line, padding, and a hover background color.
11. For the provided card divs (a card typically refers to a box containing an image and some text and/or buttons), use the display property to keep the cards on the same line. Add margin spacing of 1rem between the cards, a silver border to the card, and a width of 20rem. Add padding of 0.75rem to the card so that the content inside the content has some breathing space. Style the card button so that it is 3rem high and 15rem wide. Style the h2 tag with a font-size of 1.3rem and a font-weight of 500. If we wanted to center the items within the card, you would need to make use of flex or grid display (not covered in this tutorial).
